“Census is a necessity for the future of the country; it helps correct planning and create a rational, sensible, and favorable future in the country.”

A statement made by Iran’s Supreme Leader in his meeting with the head and the managers of the Statistical Centre of Iran on the outset of the 2011 National Population and Housing Census, October 24, 2011

Preface

National population and housing censuses used to be conducted once a decade in Iran, as stipulated by the national legislation, in the years between 1956 and 2006. The first such census was undertaken by the Department of General Statistics in 1956; subsequent censuses were taken by the Statistical Centre of Iran (SCI) in 1966, 1976, 1986, 1996, and 2006. In 2007, the Cabinet adopted that the time interval for implementation of population and housing censuses be reduced to five years from 10 years¹.

The 2011 Census was the seventh National Population and Housing Census of the country which was conducted on October 24, 2011 throughout Iran.

By providing accurate statistics and information on the size, structure, and characteristics of Iran's population, this Census serves as an appropriate tool for the country's planners, policymakers, and officials to design and implement social, economic, and cultural programs. Furthermore, this census is considered as one of the fundamental activities in national statistical system due to provision of essential frameworks for implementation of sample surveys within the areas of population and household.

A total of almost 114,000 enumerators and trained logistic and central staff participated in this national event which lasted from October 24 to November 13, 2011 in 31 provinces; 1,139 cities, and 96,459 villages²; The Census was the product of over two years of intense preparatory technical activities in the SCI in coordination with Iran's government agencies and General Governors. To gain assurance of appropriate implementation, two pilot censuses were conducted in 2009 (30 provinces) and 2010 (four provinces) and the questionnaires and the execution modalities and methods of the census were finalized and adopted by the National Census Committee based on the conclusion and lessons learnt from these two pilot studies.

State-of-the-art technical and scientific means and international experiences together with the standards and recommendations of global statistical institutions

1. Adoption No. 37147/T/26581 dated May 14, 2007.

2. The Farsi term used by the SCI is "*aabaadi*".

and also the lessons learnt during more than 50 years of work and six censuses in the country were employed by the SCI in designing the 2011 Census. During the field work of this census, four detailed forms were used to collect data on 63 items regarding population, household and housing characteristics and 77 items concerning the characteristics of Iran's villages.

The 2011 Census is different from the previous censuses. In addition to the questions on such basic indicators as population, household, and housing, the data on new subjects such as "national identity number", "access to internet (at the individual level)", "agricultural holding of the household", and "incidence of death in households were also collected through the questionnaire.

This census also experienced a shift in data collection from its conventional procedure of using paper-based forms to more advanced tool. For the first time in the history of national censuses in Iran, the data was collected through the application of Personal Digital Assistants (PDA) in the provinces of Tehran, Alborz, and Gilan to test such applications for the future censuses.

The extensive information which was extracted from this census will be made available to users within different publications and bulletins. The current bulletin which is titled *National Population and Housing Census ,2011: Selected Findings* includes some of the first and important findings of the census. The bulletin provides general and brief information and aims at providing rapid and early responses to the needs of census data users. The final and detailed findings shall be made available to users within the format of census publications and also posted on the 2011 National Population and Housing Census website (www.amar.org.ir) in the near future.

The following points are noteworthy:

In a number of the tables, the characteristics of unsettled population have not been displayed separately and are included in the total population rows. The tables where the information has been disaggregated by urban and rural areas excludes the information on unsettled population separately, the sum of population in "urban and rural areas" would not be equal to the total population and, naturally, this discrepancy is due to the number of the unsettled population.

In addition, the usual residential units which have been considered in this census include only those which were the place of residence of a household at the time of the enumeration. Those residential units which were empty at the time of the

census due to different reasons – such as units ready for sale or lease and/or units used as second residence by households – were not included in this census.

Moreover, according to the establishment of the new province of Alborz and its detachment from Tehran province, the tables related to these two provinces for the year 2006 were adjusted on the basis of the boundary of the year 2011.

The SCI takes advantage of this opportunity and expresses its gratitude to the grand nation of Iran for their invaluable cooperation and also all those individuals and institutions which played a role in the successful implementation of this census.

Definitions and Concepts

Population under Enumeration

The members of all private settled, institutional, and collective households whose place of usual residence is located in Iran at the time of the enumeration and also the members of all private unsettled households of the country comprise the population under enumeration. The members of all diplomatic missions and foreign embassies in Iran and their household members are not included in the census. The Iranian citizens who are members of diplomatic missions and Iran's embassies abroad together with their household members are, however, included in the population under enumeration.

Private Household

A private household comprises of several individuals who live together in one place of residence, share their living expenses and usually eat together. There are cases in which a private household consists of one person only.

Private Settled Household

A household which resides in a permanent place of residence (places which was made from hard materials, fixed tent, hut, straw hut, etc) is referred to a private settled household.

Private Unsettled Household

A household that does not reside in a permanent place of residence at the time of the census is a private unsettled household and comprises of the following three categories:

1. Households who are migrating (nomadic population) at the time of the census or live outside cities and settlements in a mobile shelter;
2. Households who do not live in a permanent address and are changing their place of residence constantly such as gypsies; and
3. Households who do not have a specific place of residence and usually spend the night in parks, ruins, under the bridges, etc.

Collective Household

A group of individuals, all or most of whom have selected a common place of residence for themselves because of specific circumstances (mainly common characteristics) and manage their daily affairs jointly in that place of residence form a collective household.

Institutional Household

All the individuals who live together in an institution due to a common objective or characteristics and that institution has assumed the responsibility of their accommodation (providing them with a place of residence and services and facilities) based on a license or in accordance with specific rules and regulations, form an institutional household. Some common examples of institutional households include: military barracks, police stations, and student dorms under the administration of a university excluding hostels for married people, asylums, etc.

Usual Place of Residence

The usual place of residence for a household is a place where household is residing at the time of the census provided that they do not have another place of residence. The usual place of residence of those private settled households with more than one place of residence at the time of the census is the place where they spend most of the year.

City or Urban Area

A city/urban area is a geographic locality which has a municipality.

Village or Rural Area

A village is a zone located in a rural agglomeration with independent registered or conventional boundary, outside a city boundary or outside another village with a specific name. A village is considered as a geographic zone and includes agricultural and nonagricultural lands for the activities or residence of people. Rural area could be villages, farms, mines, and the like.

Population Settled in Urban Areas

The population settled in various urban areas of counties, sub-provinces, provinces, or the whole country, is the total population in all cities located in that areas, and the population of each city is the total number of all members of private settled, institutional, and collective households, whose usual place of residence at the time of the enumeration was located in that city.

Population Settled in Rural Areas

The population settled in various rural areas of counties, sub-provinces, provinces, or the whole country, and the population of each village is the total number of all members of private settled, institutional, and collective households, whose usual place of residence at the time of the enumeration was located in that village.

Unsettled Population

Unsettled populations in a sub-province, province, or the entire country are all those private unsettled households which have been enumerated within that census zone.

Age

Age is the number of all the complete years having passed since the birth of a person.

Literate

All individuals who can read and write a simple text in Farsi or any other language are considered literate whether they have a formal certificate or not. All students including all the first year primary school beginners and learners of the Adult Literacy Movement are considered as literate,

Usual Residential Unit

A usual residential unit is one which is constructed out of hard materials (bricks, cement, stone, wood, clay, etc) for the purpose of residence.

Type of Tenure of Residential Unit

In this census, the information on the type of tenure of residential units has been gathered within the following classification:

Owned land and building: This form of tenure is related to households who are the owner of the land and building of their residential unit.

Owned building: When a household owns the building of their place of residence but not the land is called owned building.

Rented: When a household has rented their place of residence (periodic payments, lump sum deposit, or a deposit with periodic payments). Whether the rent is in cash or in-kind, it is considered a lease.

Against Service: This kind of tenure pertains to households who have occupied their place of residence in return for the services provided by one or several members of their household even if a certain amount is paid monthly.

Free of Charge: A household who has their place of residence without making any payments whether in cash or in-kind is classified in this category.

Others: This category covers all tenures of a household's place of residence which do not fall into any of the above five categories.

Floor Area of a Residential Unit

The floor area of a residential unit is the total area of the levels built under a roof in that residential unit including room(s), kitchen(s), bathroom(s), WC(s), laundry room(s), attic, etc.

In apartments, the area refers to the net area of one apartment without the common premises (parking, entrance, lobby, corridor, staircase, etc). In such units, the independent spaces of an apartment which are located outside it – such as storage – are considered part of the area.

In non-apartment residential areas, the area of all the levels constructed including corridors, staircases, the ridge of the roof, etc. are included in the area of that unit.

In a rural area, the spaces in a household's residence which have been designated for activities related to agriculture or animal husbandry such as a warehouse, stable, barn, etc. would not be considered as part of the area of that residential unit.

Skeleton

The skeleton of a residential unit is the set of supporting parts (pillars, columns, beams etc) of a building. There are three categories of these skeletons:

Metal Skeleton: This structure is erected with iron beams which are joined together and form an integrated structure which bear the weight of the building.

Reinforced concrete: This structure is built of reinforced concrete (concrete with armature and reinforcing bar) which bears the weight of the building.

Others: These are all residential units with structures which do not fall into the above two categories.

Indicators used in this report

Absolute Increase of Population / Residential Unit in a Period

The absolute increase of the population or usual residential unit in a period is the change in the number of the population or usual residential unit within that period which is computed through the following formula:

$$\begin{array}{l} \text{The number of the} \\ \text{population or usual} \\ \text{residential units at the} \\ \text{beginning of the period} \end{array} - \begin{array}{l} \text{The number of the} \\ \text{population or usual} \\ \text{residential units at the} \\ \text{end of the period} \end{array} = \begin{array}{l} \text{Absolute} \\ \text{increase of} \\ \text{population or} \\ \text{usual} \\ \text{residential} \\ \text{units during} \\ \text{the period} \end{array}$$

Relative Increase of a Population / Residential Unit in a Period

The relative increase of the population or a usual residential unit over a period is calculated through the following formula:

$$\begin{array}{l} \text{Relative} \\ \text{increase of the} \\ \text{population or} \\ \text{usual} \\ \text{residential} \\ \text{units in a} \\ \text{period} \end{array} = \frac{\begin{array}{l} \text{The number of} \\ \text{the population} \\ \text{or usual} \\ \text{residential} \\ \text{units at the} \\ \text{end of the} \\ \text{period} \end{array} - \begin{array}{l} \text{The number of the} \\ \text{population or usual} \\ \text{residential units at the} \\ \text{beginning of the period} \end{array}}{\begin{array}{l} \text{The number of the population or} \\ \text{usual residential units at the} \\ \text{beginning of the period} \end{array}} \times 100$$

Average Annual Population Growth

The average annual population growth is calculated through the following formula:

$$P_n = P_0 (1 + r)^n \Rightarrow r = \sqrt[n]{\frac{P_n}{P_0}} - 1$$

In this formula:

P_n = The population at the end of the period

P_0 = The population at the beginning of the period

r = Average annual population growth

n = The time interval between the beginning and the end of the period in years

Average Household Size

The average household size is the average number of individuals in a household which is calculated through the division of the number of the population by the total number of households:

$$\text{Average Household Size} = \frac{\text{Population}}{\text{Number of households}}$$

Literacy Rate

Number of literate people divided by population aged 6 and over and multiply by 100

$$\text{Literacy rate} = \frac{\text{Literate population}}{\text{Population aged 6 and over}} \times 100$$

Population Density

Population density is the average number of the population in a region per square kilometer of that region's area.

$$\text{Population density} = \frac{\text{Population}}{\text{Area (km}^2\text{)}}$$

Urbanization Rate

Urbanization rate is the ratio of the population settled in urban areas to the total population of the country.

$$\text{Urbanization rate} = \frac{\text{Population settled in urban}}{\text{Total population}} \times 100$$

Sex Ratio

Sex ratio is the ratio of males to females in a population by percent (M is the number of men and F is for the number of women).

$$\text{Sex ratio} = \frac{M}{F} \times 100$$

Average Floor Area

The average floor area is calculated through the following formula:

$$\text{Average} = \frac{\sum_{y=1}^n h_y \bar{x}_y}{H}$$

In this formula:

h_y = The number of usual residential units on the floor i^{th}

n = The number of the floors in the floor area

x_y = The average area built on floor i^{th}

H = The total number of usual residential units

TABLE 1. POPULATION CHANGES: 2006 AND 2011¹

Year	Population	Increase in period ²		Average annual growth (%)
		Absolute	Relative (%)	
<i>Total</i>				
2006.....	70,495,782	10,440,294	17.4	1.62
